

ASSESSMENT OF NON-OBSERVED ECONOMY IN THE REGIONAL GROSS DOMESTIC PRODUCT (RGDP) IN THE REPUBLIC OF AZERBAIJAN AND MAIN PROBLEMS

Samir Nasirov

Dissertant,

Azerbaijan State Economic University

XX

Recently finalization of the transition period in economy of Azerbaijan, changes in form and direction of involvement of the essential resources had created the problem of selection of the corresponding economic development strategy in the system of production relations. The main reason is insufficient application of SNA that characterizes regional economic relations at high level. While re-production and its formation specifications in statistical system would not be fully reflected as orderly organized system, then this situation will remain as the main problem. In this view, the necessity of more in-depth study of methodological and practical aspects of stable activity of re-production system by the economy meso-level is being increased in the context of Azerbaijan national economies. This stability could be studied and evaluated on the base of using objective national-regional economic indicators. One of the main tools of determination of social-economic de-

velopment level of the region is RGDP, which corresponds to GDP – one of the main macro-economic indicators. Basic trends of macroeconomic analysis at the regional level and their use during analysis of RGDP indicators are of main challenges. So, for solution of problems on formation and realization of regional economic policy both regional and central state administrative authorities have a great need in data on complex macro-economic analysis of the economic and social development of the regions. From this perspective, complete registration of the product, especially the coverage of non-observed economy in the regions has a great importance.

Measurement of non-observed economy in statistics, its reflection in macro indicators had been approved internationally and availability of non-observed economy at this or another level is characteristic for every country. In this context, users have to be provided with objective statistical data on non-observed

economy on RGDP and national accounts indicators should be made available. All of these challenges are accompanied with several problems related to methodology that brings into balance the indicators of various productions, collection of expenditures and assets.

Main data sources of assessment of indicators on non-observed economy in Azerbaijan are results of sample surveys conducted in the branches the share of informal activity of which is higher. As in regular reports, in the case of shortages in data directly obtained from specially conducted surveys, the balance method is of great importance for assessment of the branches of non-observed economy. Input-output tables and, supply and use tables are main tools. Regular compilation of supply and use tables in Azer-

baijan has been started since 2004 and it helped to detect superfluous discrepancies and imbalances. In some cases, balancing of supply, and use by separate products, as well as in kind is applied.

There are some challenges in the process of formation of indicators on non-observed economy during generation of macroeconomic indicators at regional level. They are characterized as survey of households' production with higher share in production at regional level, non-cov-erability of data at regional level presented by centralized report at macro level and preparation of substantial methodologies on Regional Gross Domestic Product (RGDP) at regional level. More attention also should be focused on formation of database, registry coverage and use of more effective calculation methods.

проблемы**

РЕЗЮМЕ

В предоставленной статье на основе проводимых исследований оценивается методы расчета регионального валового внутреннего продукта в системе национальных счетов азербайджанской республики, направления усовершенствования его компонентов, проблемы измерения ненаблюдаемой экономики возникающие при использовании региональной системы счетов.

SUMMARY

In this article as a result of investigations, it is estimated the calculation methods of regional GDP in national accounts system of Azerbaijan Republic, improvement of its components and the calculation problems of illegal economy while usage of regional accounts system.
